

ANSWERS TO SECTIONS 5.1 AND 5.2 QUESTIONS

Try Yourself 5.2a

A chocolate bar contains 255 Cal of nutritional energy. How many kilojoules (kJ) does it contain?

⇒ Remember: $1 \text{ Cal} = 1000 \text{ cal}$

∴ $255 \text{ Cal} = 255\,000 \text{ cal}$

⇒ Convert to joule (J):

$$1 \text{ cal} = 4.184 \text{ joule (J)}$$

$$\therefore 255\,000 \text{ cal} (4.184 \text{ J} \cdot \text{cal}^{-1}) = 1\,066\,920 \text{ J}$$

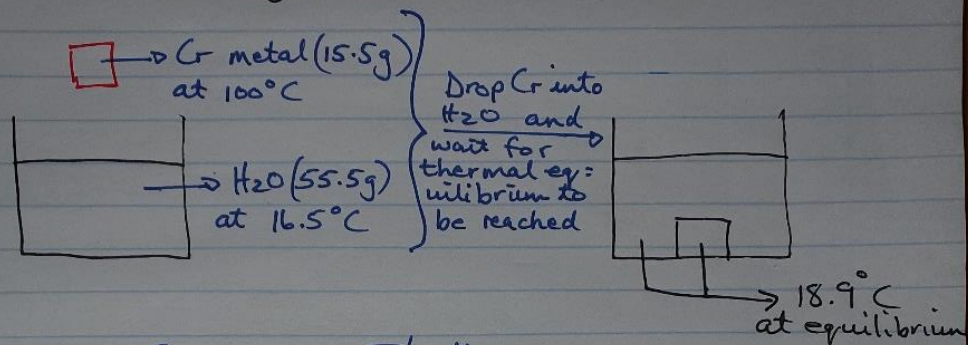

⇒ Convert to kJ ($\div 1000$)

$$\therefore \frac{1\,066\,920}{1000} = \underline{1066.92 \text{ kJ}} \rightarrow$$

● (Walking at 5 km/h will burn between 1000–1250 kJ/hour).

∴ So, you need to walk an hour to work off this chocolate 😊

Try Yourself 5.2 b

Given: $C_{H_2O} = 4.184 \text{ J/g}\cdot\text{K}$

Assume no heat energy is lost to the container or to the surrounding air.

Question: Calculate the specific heat capacity of Cr.

* Because of the law of conservation of energy in an isolated system, the sum of the energy changes (Δq) within the system must be zero.

$$\therefore q_{Cr} + q_{H_2O} = 0$$

$$\begin{aligned} \therefore q_{Cr} &= C_{Cr} \times m_{Cr} \times \Delta T_{Cr} \\ q_{Cr} &= C_{Cr} \times (15.5g) \times (-81.1K) \\ &= C_{Cr} (-1257.05) \end{aligned}$$

$$\begin{aligned} \therefore q_{H_2O} &= C_{H_2O} \times m_{H_2O} \times \Delta T_{H_2O} \\ &= (4.184 \text{ J/g}\cdot\text{K}) (55.5g) (2.4K) \\ &= 557.31 \text{ J} \end{aligned}$$

$$\begin{aligned} \therefore q_{Cr} + q_{H_2O} &= 0 \\ -1257.05 C_{Cr} + 557.31 &= 0 \end{aligned}$$

$$C_{Cr} = \frac{-557.31}{-1257.05} = 0.443 \text{ J/g}\cdot\text{K}$$

$$q_{Cr} = C_{Cr} \times m_{Cr} \times \Delta T_{Cr}$$

$$\begin{aligned} \Delta T_{Cr} &= T_f - T_i \\ &= 18.9^\circ\text{C} - 100^\circ\text{C} \end{aligned}$$

$$\text{exothermic} = -81.1 \text{ K} \rightarrow$$

$$q_{H_2O} = C_{H_2O} \times m_{H_2O} \times \Delta T_{H_2O}$$

$$\begin{aligned} \Delta T_{H_2O} &= T_f - T_i \\ &= 18.9^\circ\text{C} - 16.5^\circ\text{C} \end{aligned}$$

$$\text{Endothermic} = 2.4 \text{ K} \rightarrow$$
